

DESKTOP CUTTING MACHINES 101

AN INTRO FOR SCALE MODELERS

Harvey Low
IPMS Toronto/NENY

What is a “Desktop Cutting Machine”?

- Desktop Cutting Machine (DCM): similar to a desktop printer, but instead of printing on paper, a DCM is a programmable cutting machine that cuts onto a variety of thin materials (e.g., cardstock, masking tape, vinyl, fabric, and even thin plastics).

Relevancy for the Scale Modeler

- 1) Markings (numbers, letters)
- 2) Simple symbols (stars & bars)
- 3) Camouflage patterns
- 4) Canopy Masks
- 5) It should NOT be confused with a Decal Printer (e.g., ALPS Printer)! - Not the tool for image reproduction.

Popular Brands Today

- Cameo Silhouette
- Cricut
- USCutter
- Roland

Tips when Buying

- ✓ Wait for sales and try not to buy retail.
(many sources: Costco, Hobby Lobby, Sam's Club)
- ✓ Look for ones that have “deeper cutting capacity” (more options for modeling)
- ✓ Choose known brands with support to software, updates, and designs you can purchase or download

Required DCM Software

- 1) Many kinds of software from advanced (e.g., *Fusion 360*, *Photoshop*) to “what’s in the box” (*Silhouette Studio* w/ Cameo 4 printer). Some are costly, other design software are free.
- 2) The more advanced the software, the more tools for editing and creating masks - BUT learning curve is steep!
- 3) **BUT...Start with the software with the Printer!**
- 4) Some software such as *Silhouette Studio* (that come w/ the Cameo 4), can be upgraded. I would suggest an upgrade (cost as of 2021 is \$50). Provides added tools and functions such as rulers and Scalable Graphic File (SVG) import.

Other Things You Will Need

- 1) DCM consumables:
 - Blades
 - Cutting Mats
- 2) Different blades for different effects or materials (some blades included, some not)
- 3) **Masking Sheets** you will print on (e.g., Tamiya, Oracal)
- 4) **Transfer Tape** to help position delicate cut masks onto a surface (e.g., Oracal, Silhouette)
- 5) a **HIGH-RESOLUTION SCANNER!**

Other Things You Will Need

Blades

Transfer Tape

Masking Sheets

Cutting Mats

Cutting Blade Types in order of relevancy for Scale Modelers (Cameo 4)

- 1) Auto Blade - your “Go-To” blade
- 2) Kraft Blade - deep-cutting blade useful for scratch-building such as scribing into .010” or .020” styrene sheet. Cameo 4 has deepest Kraft Blade now of any manufacturer (3mm)!
- 3) Pen Holder - holds small pen so you can design and position patterns (e.g., camo patterns) first, before cutting the pattern.
- 4) Rotary Blade - rolls over surfaces. Good for fabrics perhaps for model display base etc. Less so for model building.

TIPS

- ✓ Use Cutting Blades designed for your cutter, but you can use ANY type of Cutting Mat, Transfer Tape, or Masking Sheets!
- ✓ Experiment reading in SVG, PDF (Vector) files too!
- ✓ Save your Masking Sheets (excess Tamiya Tape)! You can still use bits and pieces on a DCM.
- ✓ Use **Windows PAINT** for simply fast image cropping.
- ✓ Don't throw out any decals! They may come in handy one day as they scan perfectly, and can then be modified (.e.g., outlines added, size & proportions changed)!
- ✓ The best masks are from high-res images, original decal sheets, or original SVG files. Best are "darker" images!

Cutting TIPS

- Use the highest resolution images as possible!!!
- Rely on your Auto-Blade (takes guess-work out on settings)
- BUT DO set your cutting weight to 7 or 8 to save on your blade sharpness (the higher the cutting weight, the firming the cut). Default setting are around 15.
- Save as many cutting designs on a page as you can to save on Masking Sheets!

GENERAL
“HOW-TO” STEPS TO CREATE A SIMPLE
MASK

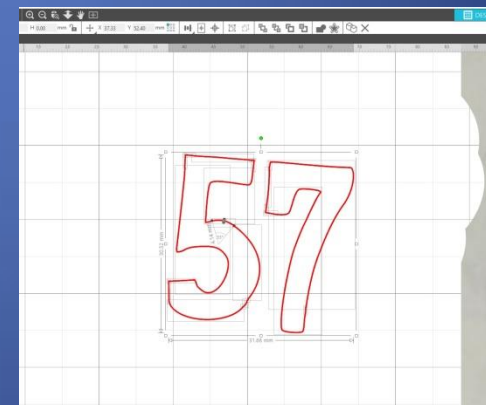

- 1) Capture the image of what you want to create a mask for. Options: Screen-capture, scan, or read in an SVG file directly.

- 2) Read image file into DCM Software.

- 3) Trace the item you want to create mask for, and clean-up, edit, copy, resize as you need.

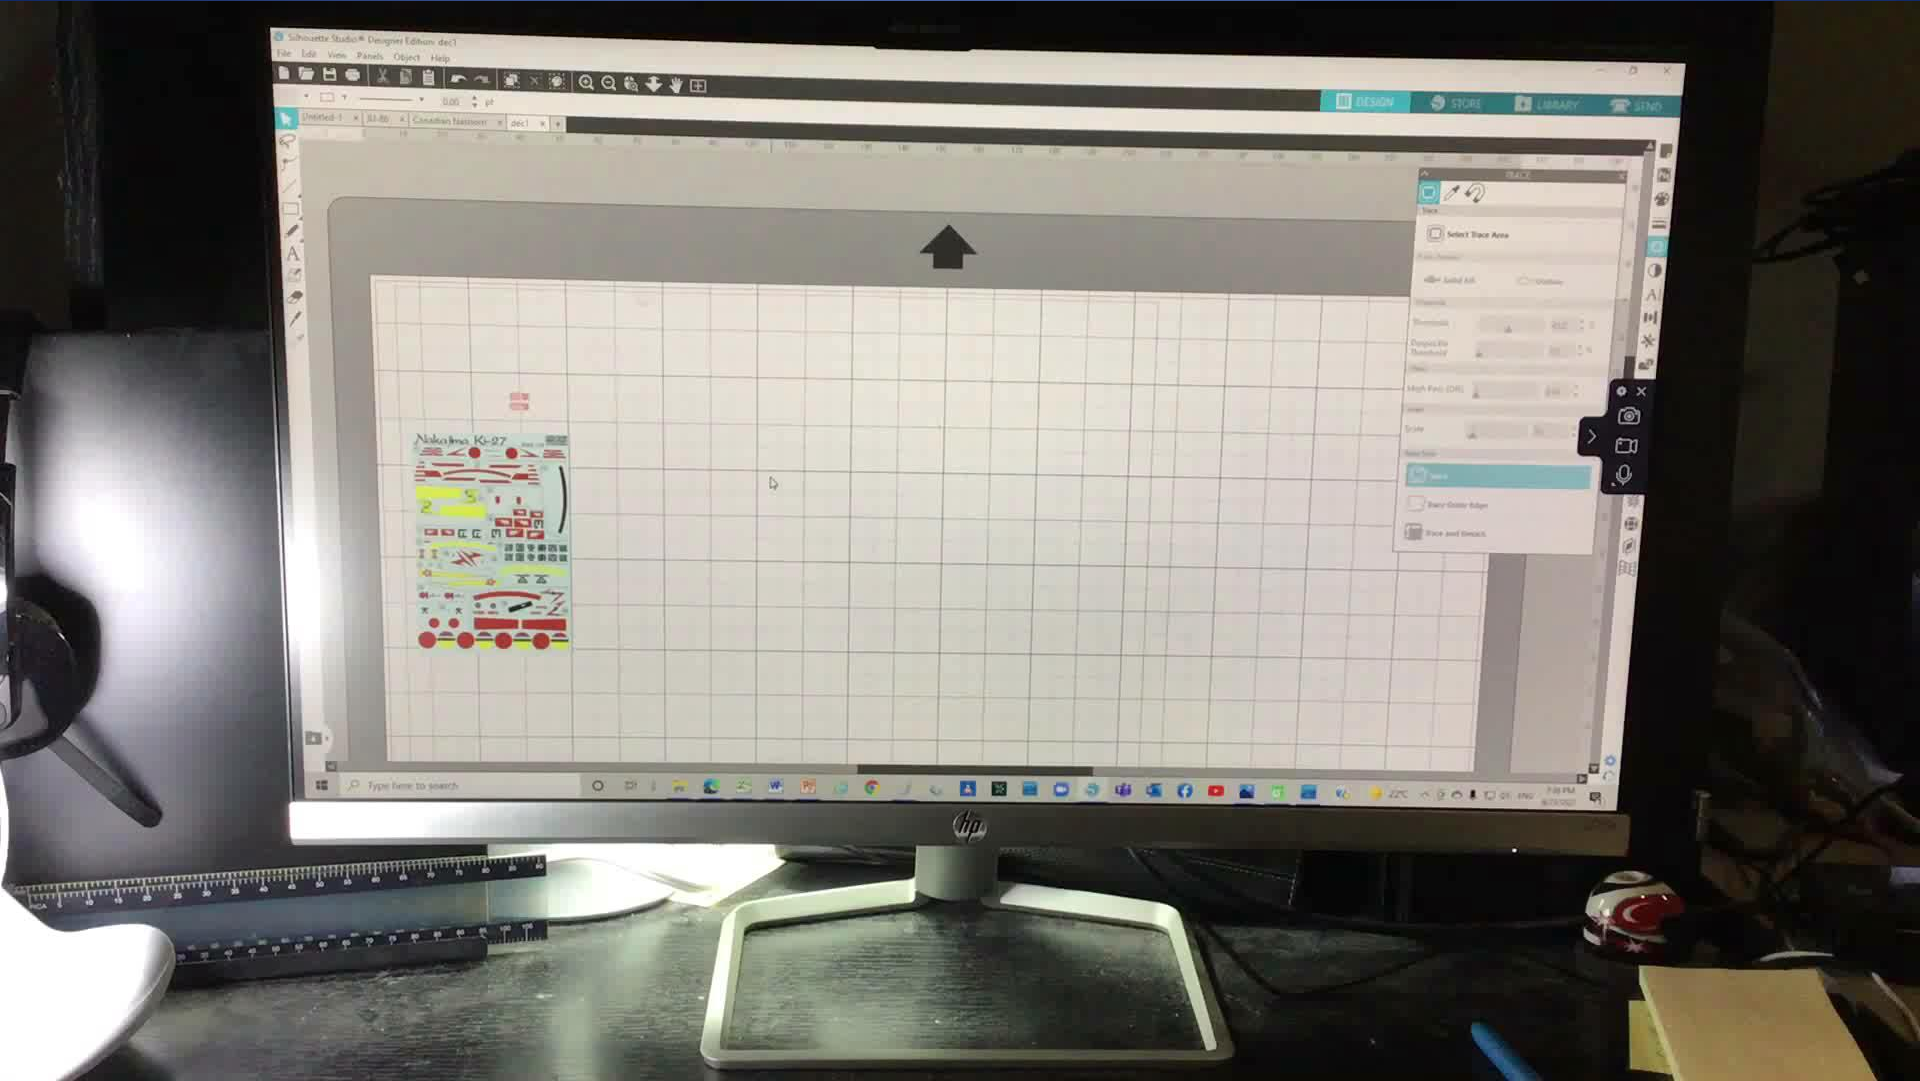

- 4) Print onto Masking Sheet!

VIDEO DEMO

**Example – Cameo 4 DCM
with its Silhouette Software**
